

## **Ph.D. Program in Ethics of Communication, Scientific Research and Technological Innovation – XXXVIII Cycle**

**Coordinator:** Prof.ssa Giulia Balboni

### **Department of Philosophy, Social Sciences and Education**

The Industrial Doctoral Course in Ethics of Communication, Scientific Research and Technological Innovation was established in the XXXV cycle for training doctors of high theoretical and methodological qualification on fundamental issues concerning the ethical aspects inherent in the management of communication in science and dissemination, the implementation of scientific research in different disciplines, and the application also in the field of innovation of the knowledge acquired.

**Educational Project:** The educational project is organized in the three curricula of Humanities, Science-Technology, and Medicine-Health to offer an attractive environment for the study of ethics and its implications in communication, scientific research, and application in the field of innovation. It is marked by a high interdisciplinary nature (the Teaching Board consists of members belonging to 20 Scientific Disciplinary Sectors from 11 CUN Areas and the ERC SH, PE, and LS areas), relationships with foreign universities (the FiSSUF Department has activity in exchange programs, visiting professors, staff mobility in/from North American, Asian and European universities; for previous doctoral cycles there are co-tutors from The Ohio State University, University of Vienna, and University of Osijek), and from a high interest in the intersectoral field (agreement with the Istituto Zooprofilattico Sperimentale dell'Umbria e delle Marche "Togo Rosati")

The training project includes higher education and advanced research activities organized within three years of the course.

*Year I:* scientific orientation and acquisition of the required specialized skills to develop, in agreement with the supervisor and one or more co-supervisors, a highly qualified research project for the doctoral thesis.

*Year II:* research work on the thesis project and stay in a university or other institution of high qualification abroad for a minimum period of 6 months.

*Year III:* research work and thesis writing.

The classes are planned mainly for the first two years. Classes are organized into about four classes common to the three curricula (about 36 hours) and about three classes specific to each curriculum (about 24 hours per curriculum). Classes aim to acquire high-level skills with in-depth study of one of the areas relevant to the Ph.D. program and methodologies and techniques of research and data analysis applicable to one's field of study. There are seminars and laboratory activities also concerning inter/multi/trans-disciplinary transversal skills that may be in common with other Ph.D. Program. Ph.D. students may also choose to attend teachings specific to other curricula of the Ph.D. Program and are invited to participate in seminars, conferences, and any intensive courses relevant to the themes of the Ph.D. Program organized by Universities, Research Institutes, Scientific Societies, and Professional Organizations.

The research activity includes, in addition to the realization of the thesis project, the following possible activities: communications at the Ph.D. day organized annually by

the Doctoral Course; reports at national/international scientific events; publications such as articles/essays in scientific journals, chapters/monographs in scientific publishers, reviews in scientific journal/curated journal; and patents. The organization of conferences/workshops; appointments in scientific associations; and receipt of scientific awards or recognition are also valued. Third mission activity is also encouraged (e.g., Sharper European Researchers' Night).

At the beginning of the year, the Ph.D. student must agree with the supervisor, and one or more co-supervisors, on an educational and research activities plan to be presented to the Teachers' Board for approval. At the end of the year, they must submit a report that will be evaluated for admission to subsequent years of the Ph.D. Program.

**Objectives:** The Ph.D. Program aims to train doctors with high theoretical and methodological qualifications on fundamental issues concerning the ethical aspects inherent in the management of communication and communication processes in science and dissemination, the implementation of research in various scientific disciplines, and the application in the field of innovation of the acquired knowledge.

The industrial doctoral characteristic will entail special attention to the study of ethical aspects inherent in the planned activity of enterprises and institutions to introduce new products/services and new methods of producing, distributing, and using them. The members of the teaching staff belonging to the ERC areas SH, PE, and LS, and the common and specific teachings in the three curricula Humanities, Science-Technology, and Medical-Health have been selected to enable the study and training in the field of ethics according to precisely a scientific-humanistic, scientific-medical and technological innovation perspective.

Ethical issues related to communication, scientific research, and technological innovation will be addressed according to the needs of these three disciplines and methodologies. To this end, research projects will be developed among members of the Teachers' Board across the curricula within which projects of individual doctoral students may be located. Interdisciplinarity, transdisciplinarity, and contamination among disciplines and methodologies of study and research, even in non-academic fields, will be fostered to develop transferable skills as well. Particular attention will be given to themes and methodologies functional to pursue the "Sustainable Development Goals identified by the United Nations General Assembly, the targets indicated in the 2030 Agenda for Sustainable Development and their declinations in European policies."

**Employment and professional opportunities:** The skills acquired can be spent in public, private, and business companies/non-governmental associations where high interdisciplinary skills are required in the management of communication with journalists, the media, and social networks; in the dissemination of results of scientific studies in health care, humanities and scientific/technological innovation (e.g., dissemination of scientific and non-specialist information); in the management of public relations; in the development of marketing strategies; in the management and solution of bioethical problems; in training and management of staff of public and private companies. Doctoral training also allows access to teaching and research in the academic and extra-academic fields in all those agencies that provide specializations in communication management.

**Duration:** Three years during which the students carry out study activities, including attending lessons with a final exam and research in Italy and abroad, and preparing a

doctoral thesis to be defended in the presence of a committee of at least three professors.

**Admission requirements and selection:** The Ph.D. Program is open to students with a master's degree obtained in Italy or abroad. Admission is based on a public selection for qualifications and an interview. The qualifications also concern a research project on a topic chosen by the candidate consistent with one of the three curricula. The project must be attached to the application form for participation in the selection and be discussed during the interview, which can also be carried out by videoconference.

Information about the selection is available at

<https://www.unipg.it/didattica/percorsi-post-laurea/dottorati-di-ricerca/bandi-avvisi-e-modulistica>

**Open positions:** Six with a scholarship (two positions are reserved for employees of the Istituto Zooprofilattico Sperimentale dell'Umbria e delle Marche "Togo Rosati").
